                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RNA. The nucleic acids are used to inhibit gene expression and/or cell proliferation, and can be used to treat a disease or condition. More than one nucleic acid can be independently targeted to the same or different sites in a cell. The nucleic acids may be used to study DNA. The modifications to the nucleic acids optimises their catalytic activity and can maintain or enhance their activity. They exhibit a high degree of specificity for RNA. The present sequence represents the coding
               oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for defection diseases caused by bacterial infectious agents
                                                                                                                                                                                                                                                                                                                                                                                                                                         14-APR-2000; 2000US-197271P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The nucleic acids are used in a pharmaceutical composition and are used to modulate expression of a gene in a plant, mammalian, bacterial or fungal cell. They are used to cleave a separate nucleic acid, preferable

```

oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is use

for detecting infectious diseases caused by e.g. Salmonella, Listeria monocytogenes and

Haemophilus influenza, bacterial infectious

agents

useful

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-
                                                                                                                                                                                                                                                                                                                             04-NOV-1998;

The method is useful CC for detecting infectious diseases caused by bacterial infectious agents CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein Barr virus and polio virus, Entamoeba histolytica and Dracunculus CC selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus CC medinesis. The method is also useful for detecting genetic diseases such CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, CC persone, human papillomavirus types 16 and 18 and liver cancers. The cc method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning CC electron microscope and infrared microscope) the support at the CC particular sites and identifying if ligation of the oligonucleotide probe consense or absence of the target nucleotide sequences. ABI82074 to CC ABI97546 represent oligonucleotide sequences used in the exemplification of the present invention.

Ribozymes having modified bases and methods for use in inhibiting disease related genes

for

producing

them

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders.

       Enzymatic and antisense nucleic acid inhibition of repressor genes useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       wrimm S, Karpeisky A, Kisich K, Matulic-Adamic J

           The invention provides new methods for the analysis of compounds, compounds next cularly nucleic acids, that use a solid support, labeled compounds and mass spectrometry. A novel method of making a set of labeled compounds, using of a support and a set of labels, comprises: (1) at clear one first or intermediate step comprising dividing the support into lots, performing a different chemical reaction on each lot of the support so as either to modify that lot of the support or to couple a chemical. CC support with a different label, and combining the lots of the support. CC support into lots, performing a different chemical reaction on each lot of the support that lot of the support with a different label, that lot of the support or to couple a chemical modely to that lot of the support, tagging a fraction on each lot of the support to that lot of the support, tagging a fraction or each lot of the support with a different label, where each different composed is linked to a chemical modety a labeled compound which is separable from the support, and combining the lots of the support. The controlleds and products are used for the analysis of chemical components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim

The invention relates to a nucleic acid molecule necession of a CD20 gene and a nucleic acid molecule necession of a neurite growth inhibitor gene (NOGO). regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids (e.g., a ribozyme or a The nucleic acids (e.g., a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme motif). The CD20-targetting nucleic acid is used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
```

Qy

The present sequence is a Drosophila mus101 genomic

primer which is used to sequence and partial cDNAs. The mus101 is

the a member of

```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer is specifically associated with a gene selected from BRCAl gene, passociated with a gene selected from BRCAl gene, and inference of the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification of the present invention.
                                                                                                                                                                              WPI; 2001-418282/44.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and pollo virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                probe and mus101 polynucleotide in the sample. The mus101 and its polynucleotide are useful in gene therapy. The mus101 is useful for identifying a substance capable of affecting mus101 function, and the substance is useful for treating tumour, for inhibiting mitosis and for increasing the susceptibility of a tumour cell to a DNA damaging agent. The mus101 is also useful for identifying substances which affects DNA repair and cell cycle regulation, in vitro or in vivo cell culture system to study the role of mus101 and its homologues in disease, and as immunogens. The antibody to mus101 is useful in diagnosis and in passive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BRCT (BRCA1 C-Terminus) superfamily. The mus101 polynucleotide probe is used for detecting the presence or absence of mus101 polynucleotide in a biological sample by bringing the biological sample containing DNA or RNA into contact with mus101 polynucleotide probe under hybridising conditions, and detecting any duplex formed between mus101 polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18
                                 The invention relates to specifying complex microbes as an index to evaluate a water treatment process. The method involves: (1) extracting microbial DNA which cannot be adapted; (2) amplifying partial regions of the microbial genes; (3) separating the aggregate of the resultant DNA fragments; and (4) using the DNA to compare the growing conditions of the microbes and conditions of the water treatment process. The present sequence represents a probe specific for a 16s rRNA encoding DNA, used in the course of the invention.
                                                                                                                                                                                                                                                                                                               WPI; 2002-440454/47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-APR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         JP2002101884-A.

                                                                                                                                                                                           Sequences AAV71835 to AAV71841 represent PCR primers specific for the banana bunchy top virus (BBTV) DNA. The invention provides BBTV DNA I (clone 7-4-2) circular single stranded (css) DNA, CC and DNA II (clone 2-17) css DNA sequences (AAV71832 and AAV71833) and the proteins (AAW87459 and AAW87460) encoded by the open reading frames in the nucleotide sequences. The nucleic acid sequences (AAV71830 to AAV71833) are used as the basis for the construction of PCR primers, to detect BBTV infection. The PCR technique is used for detecting BBTV in plant tissues (preferably banana, especially Musa species). The virus, one of the most important banana species viruses, causes phloem damage and is transmitted by aphids. PCR detection gives accurate, reliable and specific determination of absence or presence of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids having banana bunchy top virus component sequences used to design primers for use in polymerase chain reaction detection of the virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated that the control of the control
